Few things in life are more irresistible than the image of a roly-poly puppy running through the house. While that picture may be cute, however, it isn’t always healthy.

When deciding what to feed your new puppy, make sure you get reliable, professional veterinary advice on:

- What type of diet to choose
- How much food to feed
- How to adjust your puppy’s diet as your puppy grows into adulthood

Veterinarians are your best source of information to help you make more informed choices about which brand of food to feed or what kinds of rewarding treats to give your little friend for good behavior.

**Eating Right—Nutrition Basics**

Puppies should eat a diet that contains protein, fats, carbohydrates, vitamins, minerals, and water in the proper proportions. Commercially produced puppy foods must meet AAFCO (Association of American Feed Control Officials) nutritional standards. Pet foods that meet AAFCO standards are marked with the phrase “complete and balanced” and, in the case of puppy foods, should be formulated for growth. Any diets that meet these guidelines won’t require any additional supplementation—the diet will include all necessary vitamins and minerals. Don’t forget to also make sure your puppy has a continuous supply of fresh, clean water!

There are many commercial puppy foods on the market, but if you need help making a selection, ask a veterinary professional for advice on what products offer the right nutritional mix for your pet.

**How Much and When?**

Typically, tiny puppies—those under 12 weeks of age—should eat three to four times a day. Once a puppy is 3 months old, he or she can generally make the switch to eating two to three times a day. The frequency of feedings, however, will depend on the puppy’s breed, size, and individual needs. This frequency should continue until the puppy has reached adulthood.

Growing puppies require significantly more food for their size than adult dogs. The feeding guidelines listed on your pet

**Read the Label**

Under federal Food and Drug Administration (FDA) regulations, every puppy food must include a label listing its ingredients and a guaranteed analysis of how much protein, fat, and other important nutrients are in it. Reading the percentages can get complicated, so one of the best quick ways to assess the quality of a diet is to look at the ingredient list. By law, the pet food manufacturer must list the ingredients by weight. For more information on reading pet food labels, visit [www.fda.gov/AnimalVeterinary/ResourcesforYou](http://www.fda.gov/AnimalVeterinary/ResourcesforYou) and click on “Pet Food Labels—General” under “Information for Consumers Fliers.”
food bag are a good place to start, but you should monitor how well those amounts seem to be meeting your puppy’s needs. A puppy that is leaving food in the bowl at mealtimes or becoming too pudgy may be eating too much; a puppy that seems lethargic or excessively thin may not be getting enough.

It’s also important to set a regular schedule for feeding your puppy. A good schedule helps prevent stomach upsets and supports house-training of your young pup.

**Large Breed vs. Small Breed**

Just picture a huge Great Dane puppy standing next to a tiny Chihuahua puppy. They’re both dogs—and members of the exact same species—but their nutritional needs during puppyhood and young adulthood are completely different.

Small-breed dogs mature faster, typically have faster metabolisms, and have tiny mouths and teeth. They often need puppy diets that are easy for them to eat and chew and that are more “energy dense” to help keep up activity levels and encourage proper growth and development. In addition, small, toy, or teacup breeds may need to eat more often.

Large-breed dogs, on the other hand, often mature at a slower rate and are prone to developing joint (e.g., elbow and hip) problems if they eat too much and grow too rapidly. Excess body weight can also stress developing bones. For these reasons, it is vitally important not to overfeed large-breed puppies.

Thankfully, there are a number of commercial diets specifically for dog breeds of different sizes. Diets designed for large-breed puppies, for example, are typically less energy dense and, therefore, are less likely to be overfed. Ask a veterinary professional for advice if your puppy belongs to a particularly large or small breed.

**Feed by the Puppy, Not by the Package**

The key point to remember is that every puppy is different, and no single diet will work best for all pups. To ensure a healthy adulthood for your puppy, seek professional advice, educate yourself about good puppy nutrition, and carefully monitor your puppy’s growth rate, activity level, and body condition as he or she grows.
